-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: COLON, SMALL INTESTINE, COLONIC TUMC
-!- TISSUE SPECIFICITY: COLON, SMALL INTESTINE, COLONIC TUMC
BRONCHUS, CERVIX AND GALL BLADDER.
-!- PTM: ALL CYSTELNE RESIDUES ARE INVOLVED IN INTRACHAIN OF
-!- POLYMORPHISM: THE NUMBER OF REPEATS IS HIGHLY POLYMORPHI
VARIES AMONG DIFFERENT ALLELES.
-!- SIMILARITY: Contains 1 C-terminal cystine knot-like (CTC
-!- SIMILARITY: Contains 1 TIL (Trypsin inhibitory-like) don
-!- SIMILARITY: Contains 2 VWFC domains.

Derive of this sequence substd. on the N-terminal amino gp. by

N alpha (alpha-glucosyl(1-4)deoxyfructosyl)

or N alpha-(beta-deoxyfructosyl) are pref. for oral administration.

The cpds. are esp. used to prevent, inhibit or treat respiratory
distress syndrome in children and adults, and to inhibit or treat
damage caused by oxygen therapy. Opt. they are formulated with a
glucocorticoid steroid. The y are also known to inhibit release of
growth hormone, insulin, and glucagon, and to reduce gastric secret:

These peptides are based on sequences from the tetradecapeptide somatostatin but have deletions, substitutions or inclusions when compared to the wild type sequence. These sequences may be used in a compound to inhibit growth hormone secretion and pancreatic and gastric secretion. This compound may be used in the treatment of acromegalty, complications of diabetes mellitus or gastro-intestinal disorders. These peptides may also be used to alleviate chronic, life-disrupting headache associated with pituitary tumours and also

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               and gastrointestinal disorders such as peptic ulcer, enterocutaneous and pancreaticocutaneous fistula, irritable bowel syndrome, dumping syndrome, watery diarrhea syndrome, acute pancreatitis, gastroenteropathic endocrine tumors (e.g. vipomas, GRPomas, glucagonomas, insulinomas, gastronomas and carcinoid tumours) and gastrointestinal bleeding, and diabetic complications. The microparticles are used in anticancer treatment, neuroregulators, growth hormone inhibitors, central nervous system inhibitors, peripheral nervous system inhibitors, vascular smooth muscle inhibitors, insulin inhibitors and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       octreotide. The microparticles are used for sustained-release formulations of drugs, particularly water soluble peptides e.g. somatostatin or somatostatin analogs, such as octreotide, as well as calcitonin (e.g. salmon calcitonin) and lypressin. Microparticles produced are used in the long-term treatment of disorders associated with excess growth hormone secretion such as acromegaly, breast cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   neovascularisation (CNV) related disorder. The control of ocular neovascularisation is regulated a balance between stimulating and inhibiting growth factors. The medicine is useful for the treatment of CNV related diseases, especially exudative age-related macular degeneration. The somatostatin receptor binding compounds stop leakage in existing and new ocular vessels and inhibit neovascularisation in age-related macular degeneration and diabetic retinopathy.

The method is used to treat ocular disorders particularly vision loss due to progressive retinal and/or optic nerve disease such as glaucoma, retinitis pigmentosa, diabetic macular oedema and age related macular degeneration. The present sequence is somatostatin analogue peptide also known as lamerarian.

When halogenated, these analogues are found to bind somatostatin receptors with such high affinity that binding is nearly irreversible under physiological conditions. Therefore, by using radioactive halogenated analogues, the invention claims for improved sensitivity of radiolocalisation of the receptors. The multi-tyrosinated somatostatin analogues (AAMW88641-W48646) bind to somatostatin receptors with practically the same affinity as native somatostative to conventional somatostatin analogues, are resistant to vivo relative to conventional somatostatin analogues, are resistant to enzymatic degradation and have increased blood-brain barrier
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Homo sapiens.

(I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes. AAB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; G-protein coupled receptor; GPCRx11; cerebroprotective; vomiting; receptor-mediated disorder; therapy; urinary retention; allergy; obesity; osteoporosis; angina pectoris; restenosis; atherosclerosis; hypotension; anorexia; tumour; migraine; acute heart failure; ulcer; antiinflammatory; stroke; hypertension; neuronal disorder; myocardial infarction psychotic; depression; mental retardation; neurodegenerative disease; antibacterial; Alzheimer's disease; dementia; ischaemia; Parkinson's disease; antiviral; funtington's disease; dementia; ischaemia; Parkinson's disease; anticty; vulnerary; analgesic; anorectic; anabolic; diuretic; cardiant; nootropic; universal; vasotropic; diabetes; cancer; tranquillizer; neuroleptic;
